

# Access Control

## Access Control seamlessly controls the flow of traffic to and from a certain point

Use biometrics to accurately identify employees, keep this information stored safely in the cloud

- Restricted access to certain areas;
- Accurate employee time and attendance records;
- Remote support;
- Full auditable data for incident reporting;
- Streamlined access control experience for visitors;
- Pre-arranged access for meeting or visiting purposes.

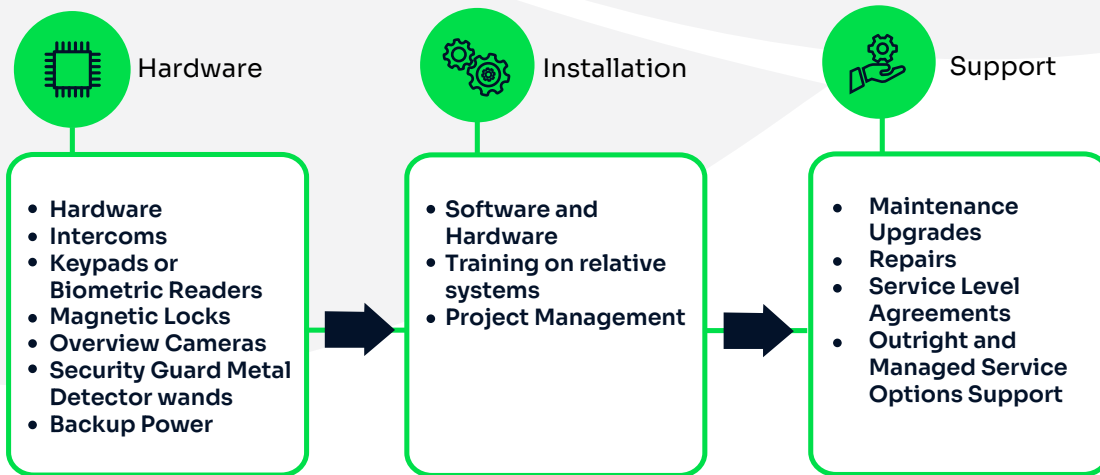

## Product Overview

Guardian Eye Access Control is an electronic system that facilitates automated approval for authorised personnel to enter through a **security portal** without the need for an in-person security guard to review and validate that entrance. Typically by using a credential to present to the system to verify their authorisation. Security portals include **standard doors, vestibules, revolving doors, and vehicle entry barriers.**

All these processes are managed by Guardian Eye's secure, specialised **Access Control backend software**, as well as developed backend software.

An access control system will **take note of every person** who walks in and out of your door throughout the day. If in an unfortunate circumstance a criminal or intruder were to trespass your premises, this log will prove invaluable in resolving the case.

# How it Works

## Features and Benefits

### Immediate identification, authentication and authorisation

Accurately identify a person or vehicle that needs access to any premises, biometrics can be used to identify employees

### Manage Access with ease

Restrict access to certain areas at various times throughout the day

### Full auditable data for incident reporting

Keep information safely stored in the cloud for accurate record keeping of entrances and exits

### Physical access control

Achieved through hardware solutions on premises

**Maintain access control at all times**
